

# GPS ANTENNA CALIBRATION AT THE NATIONAL GEODETIC SURVEY

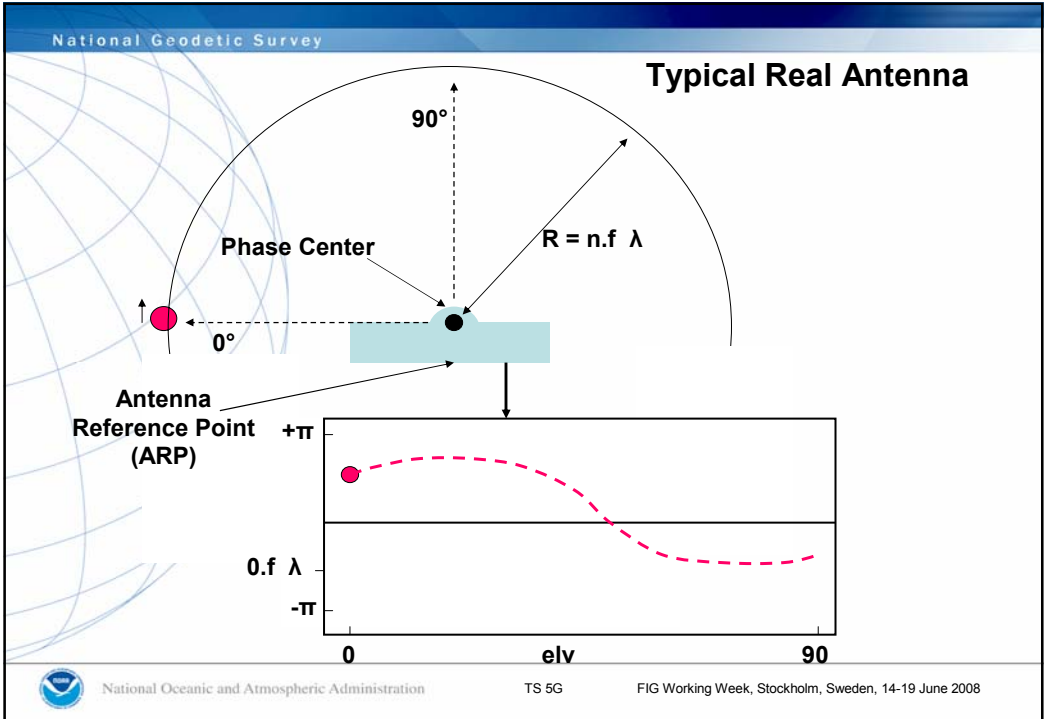

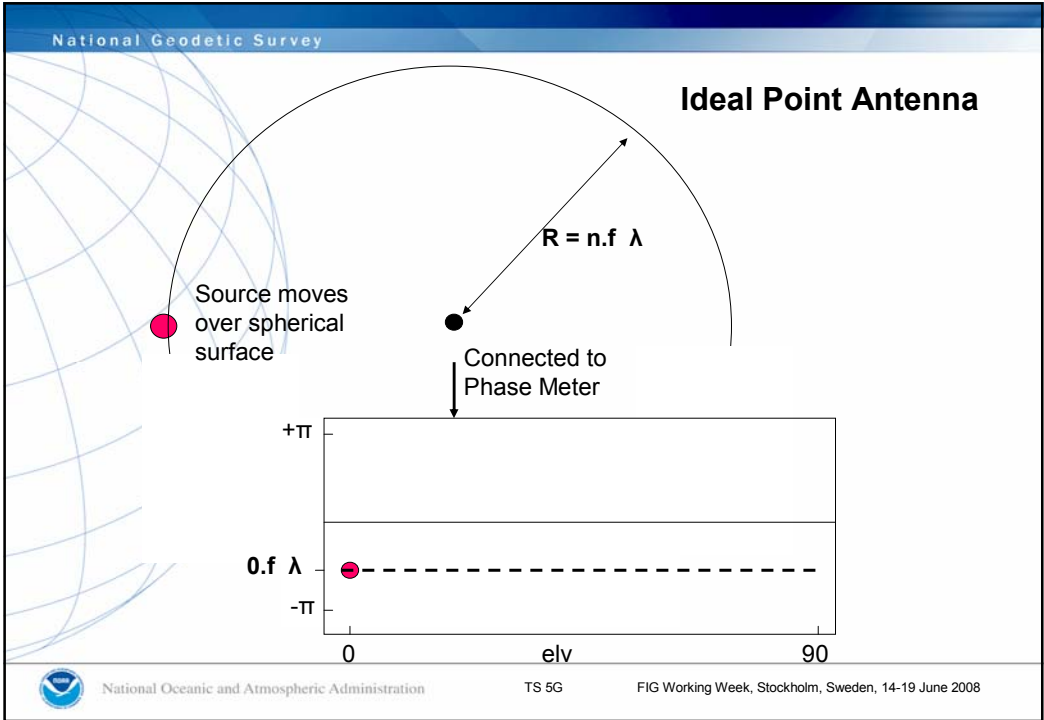

Gerald L. Mader & Neil D. Weston  
Geosciences Research Division  
National Geodetic Survey, NOAA  
Silver Spring, MD. USA

## Why GPS Antenna Calibration

- Goal is to determine GPS antenna characteristics which provide accurate geodetic positions.
- Initial questions
  - What is the location of the point being positioned?
  - What does the antenna contribute to the observed phase measurements?

National Geodetic Survey

## The Antenna Models Show

- A phase center may vary and can be estimated
- An offset and phase center variation (PCV) must be applied to yield correct distance to the source
- Different phase centers, when corrected for offset and PCV give identical results
- There is no phase center for which PCV is zero – but can be minimized

National Oceanic and Atmospheric Administration TS 5G FIG Working Week, Stockholm, Sweden, 14-19 June 2008

## Antenna Phase Center Variations (PCV)

- All real GPS antennas have a phase variation pattern
- These phase variations depend primarily on elevation
- Phase variations also depend on the physical components of the antenna and its environment
- Observed phase includes satellite phase and phase due to the local environment and GPS antenna

## What's The Effect of PCV?

- Applies an elevation dependent phase variation to the observed phase data
  - Makes height sensitive to elevation angle
  - Looks like troposphere variation - leads to incorrect tropo scale factors and heights
  - Especially pronounced for mixed antenna baselines - 10 cm height errors are not unusual
  - Mixing antennas and having longer baselines demand good antenna calibrations

## Why Do Antenna Calibrations?

- GPS determines position of antenna phase center
- Phase center must be related to physical point
- Phase center locations are not fixed
- Phase center locations depend on direction to satellite
- Phase center variation is different for each antenna type

## How Can We Do Antenna Calibrations In Practice?

- Could use Anechoic Chamber
  - Signals not reflected from another part of the chamber
  - Expensive, scheduling
- Use GPS constellation, but ...
  - Orbits not spherical with respect to the antenna
  - Satellite/receiver clocks mask antenna effects
  - Propagation variation masks antenna effects

## Use Differential GPS

- Short baseline
- Standard reference antenna
- Relative calibrations
- Orbits errors cancel out
- Propagation cancels out
- Satellite clocks cancel out
- Receiver clocks solved for
- What's left over is antenna contribution

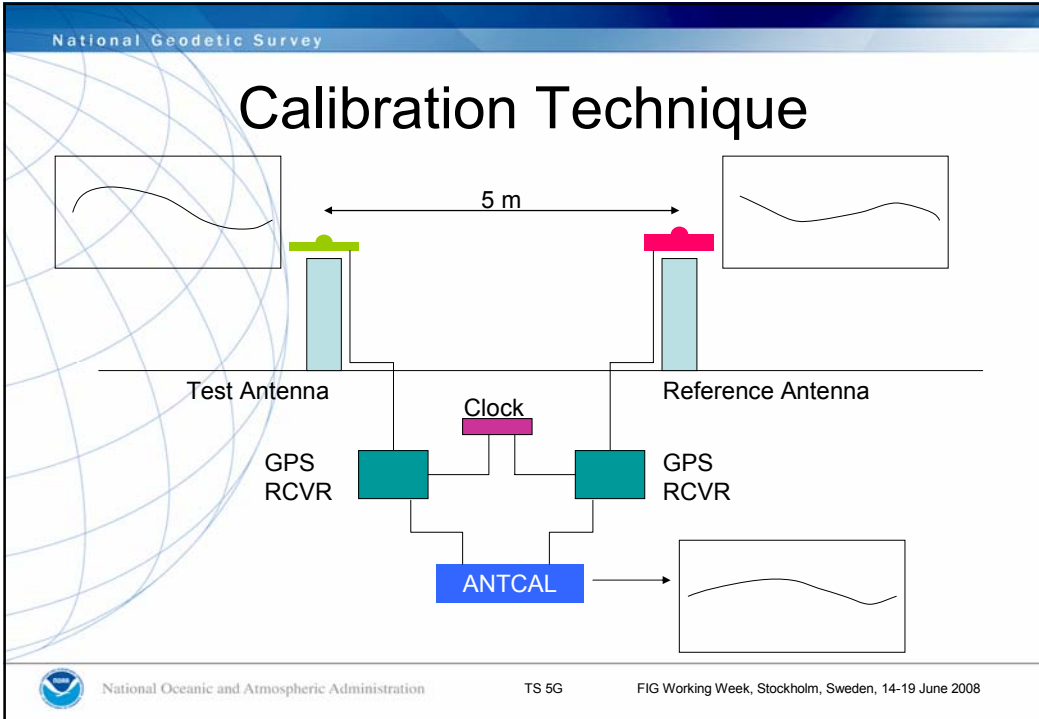

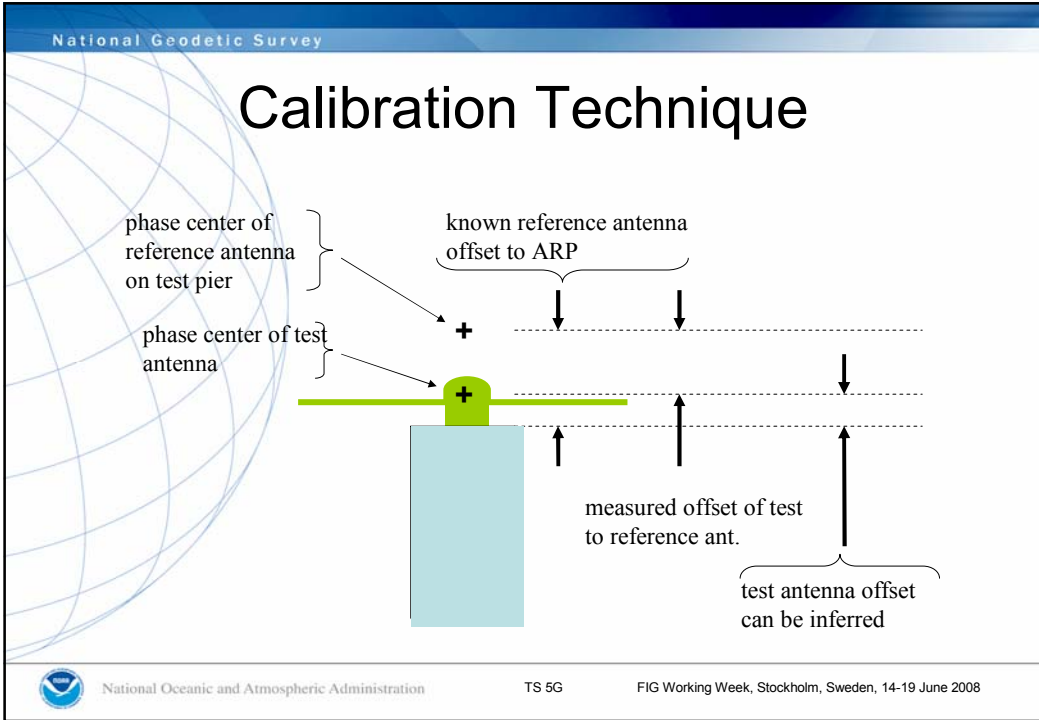

## Calibration Technique

## NGS Antenna Calibration

- Permanent antenna testing facility at Corbin, VA
- Dedicated equipment and personnel
- Produce reliable antenna phase offsets/patterns for 'all' GPS antennas
- Evaluate reliability and repeatability of antenna measurements
- Establish public distribution of 'standard' antenna calibrations

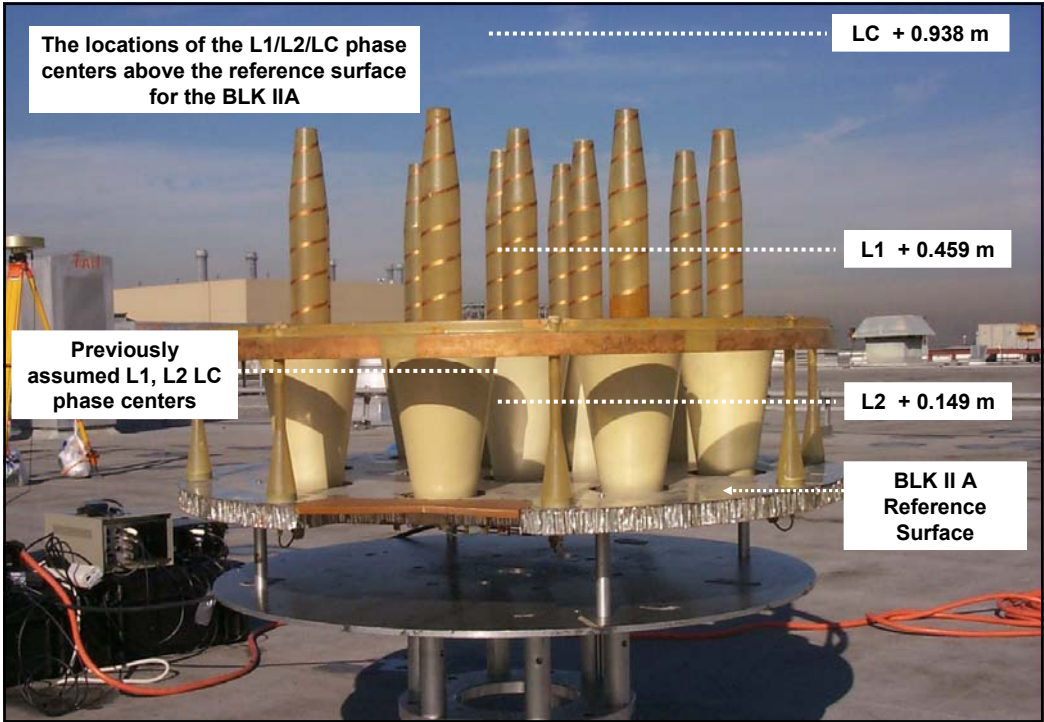

National Geodetic Survey

# Calibrating the L1 and L2 Phase Centers of a Block IIA Antenna

National Oceanic and Atmospheric Administration      TS 5G      FIG Working Week, Stockholm, Sweden, 14-19 June 2008

The locations of the L1/L2/LC phase centers above the reference surface for the BLK IIA

LC + 0.938 m

L1 + 0.459 m

L2 + 0.149 m

BLK IIA Reference Surface

Previously assumed L1, L2 LC phase centers

# Thank you
