

AuScope

AN ORGANISATION FOR A NATIONAL
EARTH SCIENCE INFRASTRUCTURE PROGRAM

Australian Earth Science Research Spatial Information Infrastructure

Dr Robert Woodcock
AuScope Grid - Director

Outline

- Why build an Earth Science Spatial Information Infrastructure?
- What is AuScope?
- What is an Information Infrastructure?
- Building an Earth Science Information Infrastructure
- The AuScope Earth Science Information Infrastructure

2

Decisions, decisions...?

knowledge base

Commonwealth

State

Local

Regional

Industry

Research

decision makers

?

AuScope

With acknowledgement to Boyan Brodaric, Natural Resources Canada

3

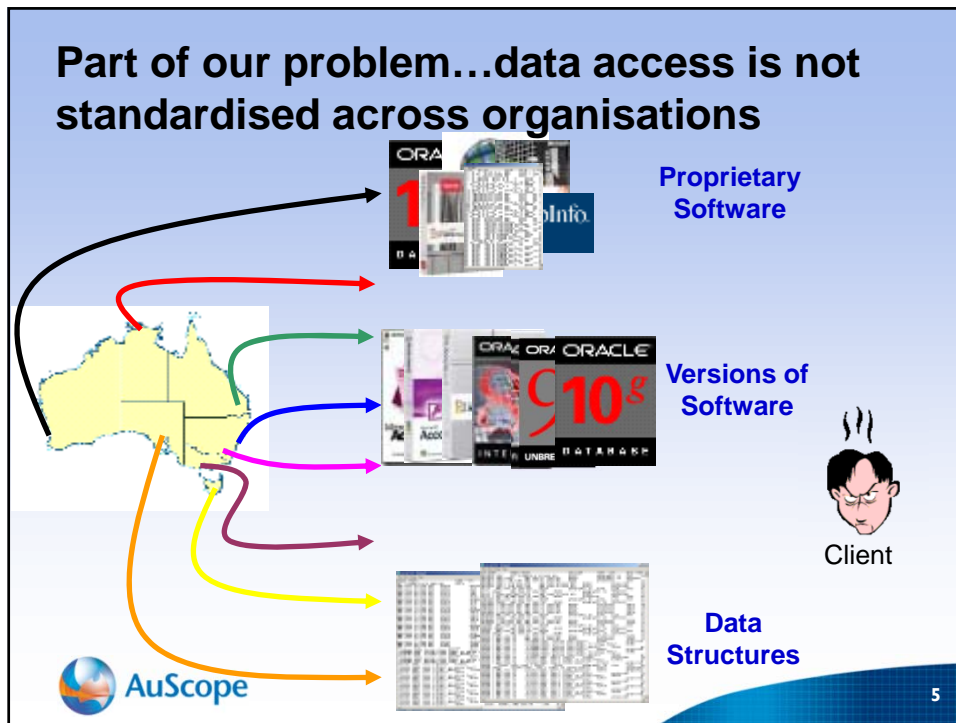

Don't you hate it when.....

- You have to keep and maintain versions of someone else's data, and you don't know if it's correct or outdated?
- You know there's useful information out there, but you cannot find it?
- You waste valuable time downloading and converting datasets?
- You can see the data you want on a web map but you can't download the real data for analysis?

AuScope

4

Minerals Industry: Persistently driving

- Recommended actions
 - “Development and endorse a plan to upgrade ... the Geoscience portal..
 - Endorse ... standards for company exploration data submitted to Mines Departments
 - Implement web-based services ...
 - Develop and endorse a plan for implementation of an Australian Earth Science Grid”

AuScope

See www.industry.gov.au/assets/documents/irinternet/Road_to_Discovery20040702155050.pdf?CFID=28444444&CFTOKEN=15505050

6

The problem runs deeper...information is part of a workflow across organisations

- Water Resources
 - Bureau of Meteorology – legislative mandate on water data
 - ~300 data providers
 - Dozens of data products
- What format?
 - 95% say Comma Separated Values – what about relationships?
 - Is “T” Temperature, Time, Total, Turbidity?
 - What about Units of measurement? Temperature, Kelvin, Centigrade, Fahrenheit?

7

It's all too hard

8

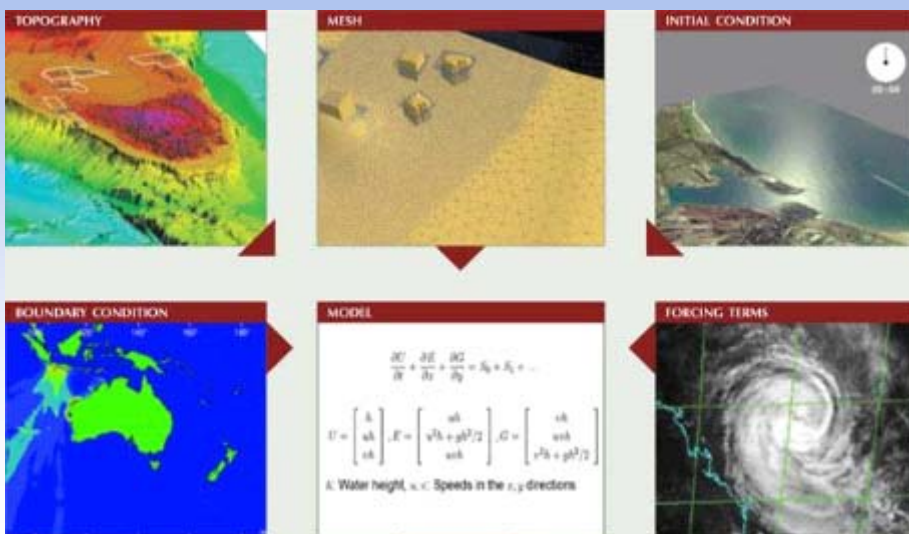

AuScope

AN ORGANISATION FOR A NATIONAL
EARTH SCIENCE INFRASTRUCTURE PROGRAM

What is AuScope?

**Earth Science *Research*
*Community***

Integration of observations, models, simulation...

10

Analysis Workflows

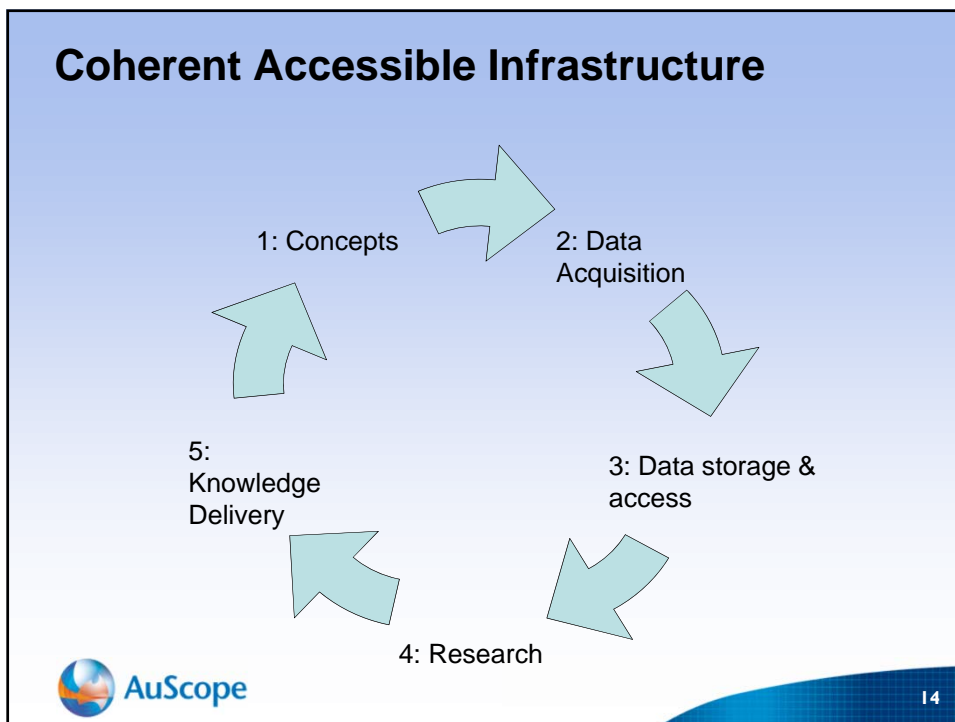

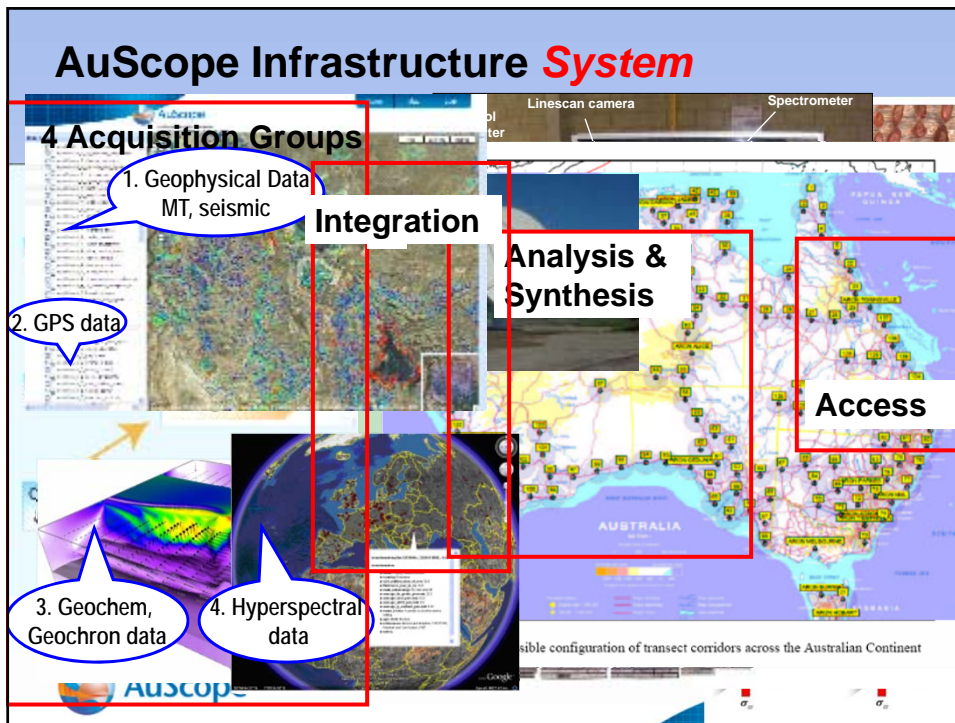

11

National Collaborative Research Infrastructure Strategy

- NCRIS – a new Australian Government Initiative
- Australian Government: ~\$500M for FY06-FY11
- 11 Capability Areas + one Systemic ICT Infrastructure
- NCRIS Principles
 - “Major infrastructure ...should serve the research and innovation system broadly, not just the host / funded institutions
 - “...seek to enable the fuller participation of Australian researchers in the international research system”

12

AuScope

AN ORGANISATION FOR A NATIONAL
EARTH SCIENCE INFRASTRUCTURE PROGRAM

What is an Information Infrastructure?

**Data sharing, applications,
discovery and access**

What hat do you wear? Consumer, Provider or both!

Consumer

Standardise Information models
Standardise the Query interface

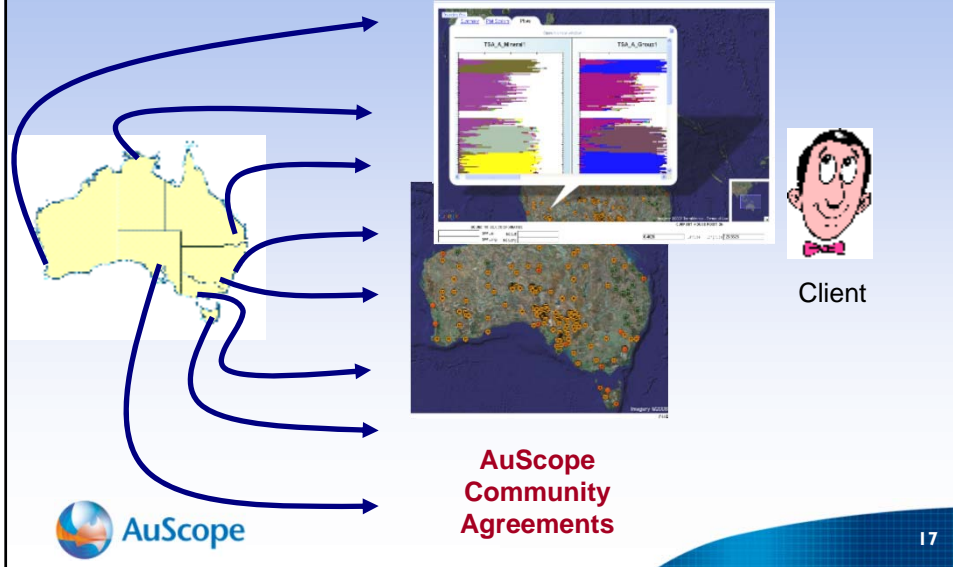

Provider

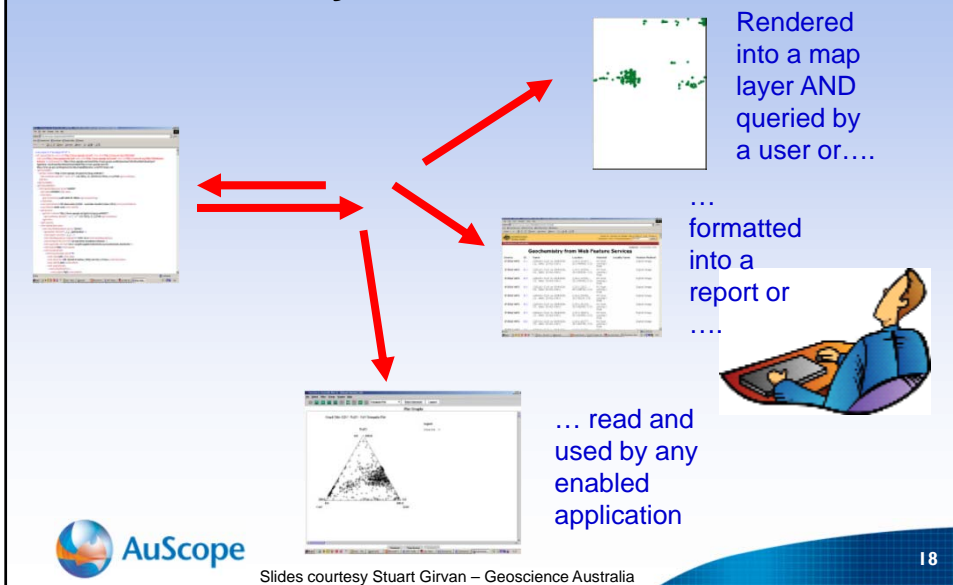

Do *not* change my internal operations dramatically (*including databases*)
Should *not* second guess the *consumers* workflow

16

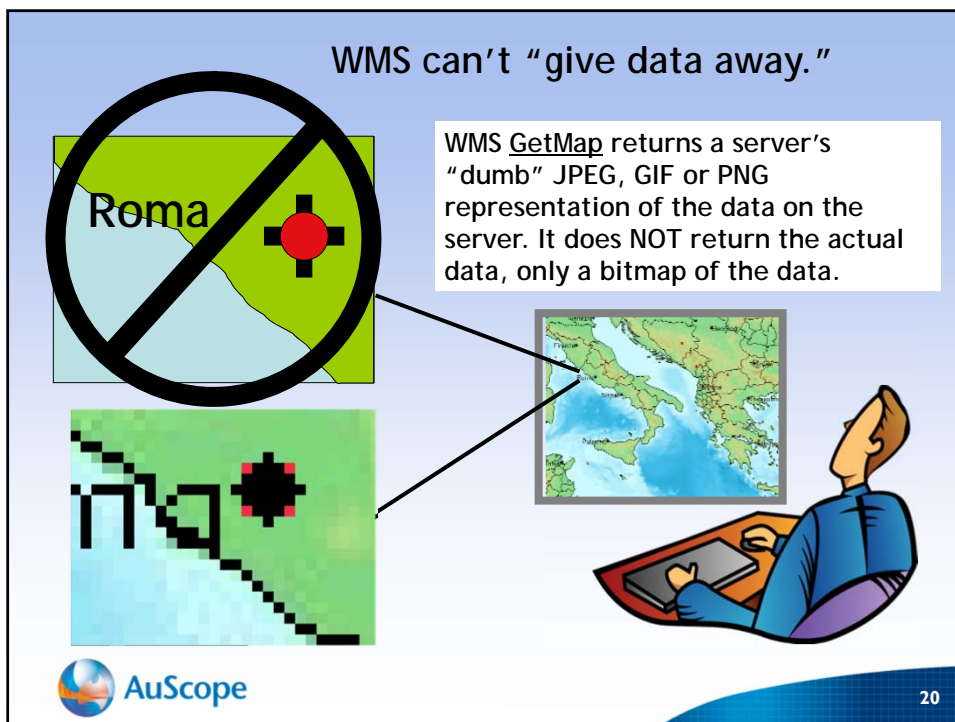

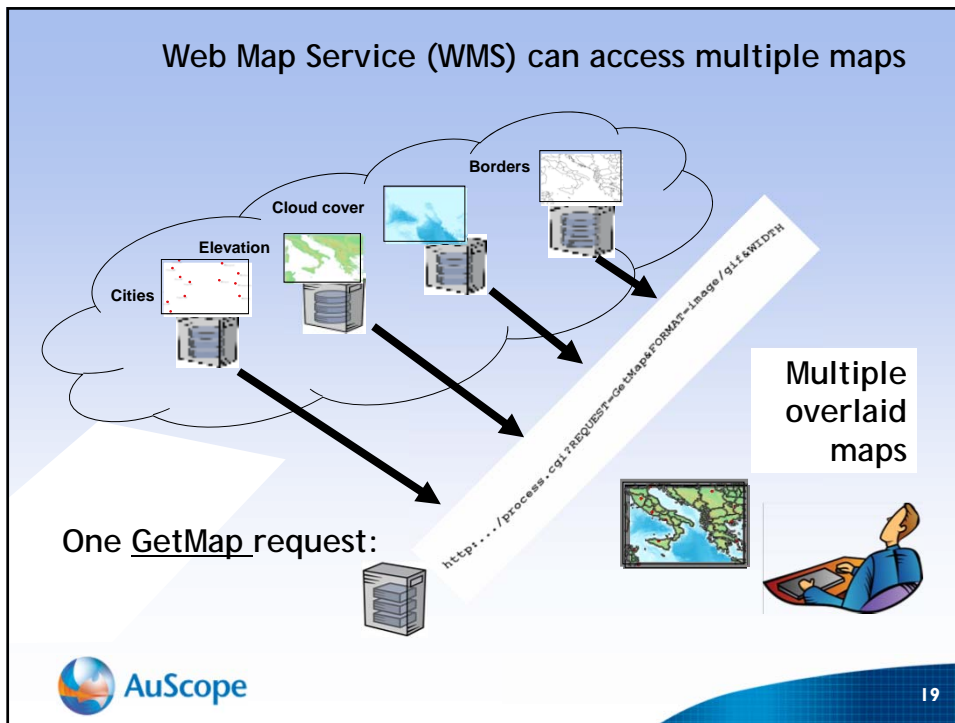

A solution: Open standards based earth science information infrastructure

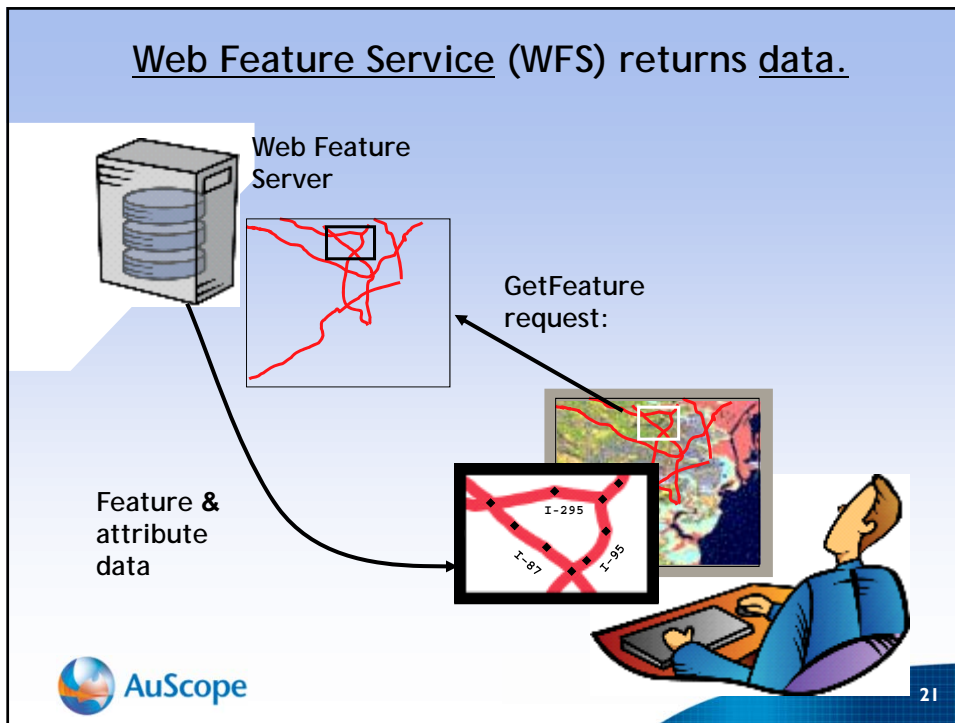

Applications: It's not about you...it's about them.

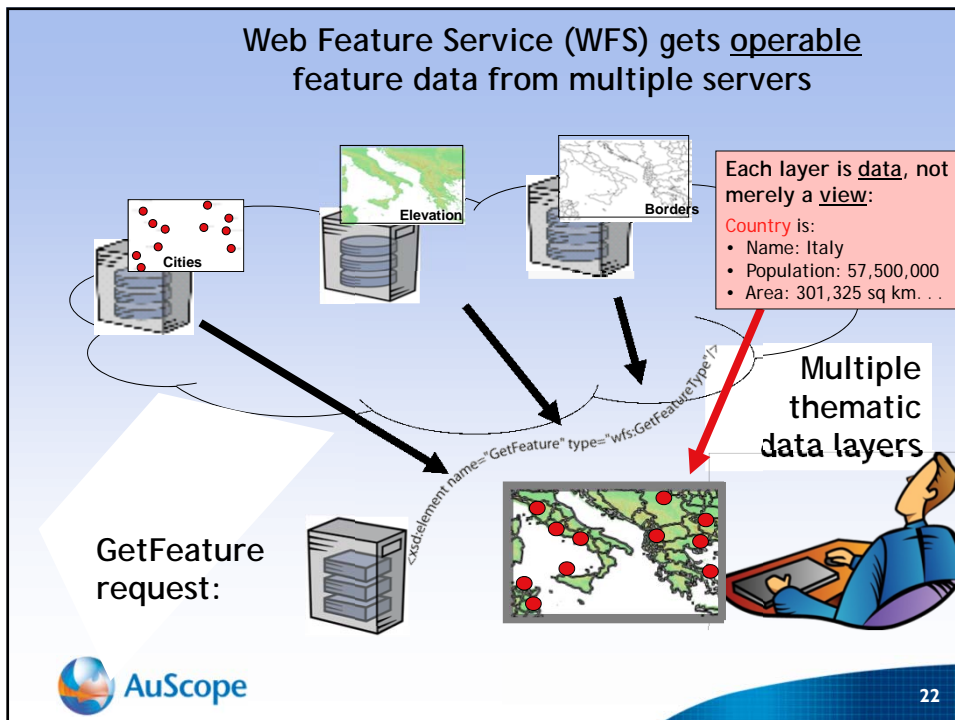

Slides courtesy Stuart Girvan – Geoscience Australia

Web Feature Service (WFS) returns data.

Web Feature Service (WFS) gets operable feature data from multiple servers

Portrayal vs Analysis Simple vs Community Schemas

Data can be easily exchanged within communities where meaning is understood and humans are involved

Property = temperature, (*only*) *Value* = '15-20'

For use in wider communities more precise definitions are required that reflect the complexity of the real world

Property = temperature,

Value = 15 *Unit* = C *Instrument* = thermometer

Value = 17 *Unit* = C *Instrument* = thermometer

Value = 20 *Unit* = C *Instrument* = thermometer

OR

Property = temperature,

MinValue = 15 *Unit* = C

MaxValue = 20 *Unit* = C

Agreement at an international level enables data to be reused, *repurposed* and used by other domains globally

23

AN ORGANISATION FOR A NATIONAL
EARTH SCIENCE INFRASTRUCTURE PROGRAM

Building an Earth Science Information Infrastructure

- ...locally for access nationally and globally
- ...to provide access to authoritative, high quality, data and information
- ...to enable reuse and repurposing of data and information
- ...to integrate with other national and state network initiatives

1st Step: Standardise the Information Models

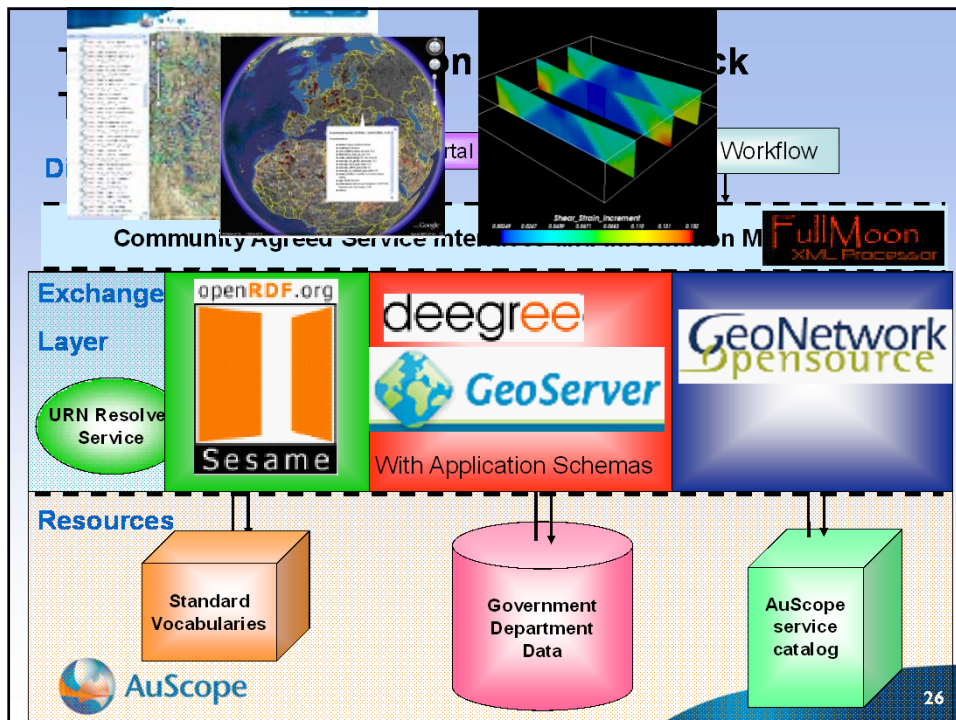

- Not a storage problem...
 - Exchange
- Semantics and structure
 - GeoSciML, OGC
- Tool support
 - Creation and validation

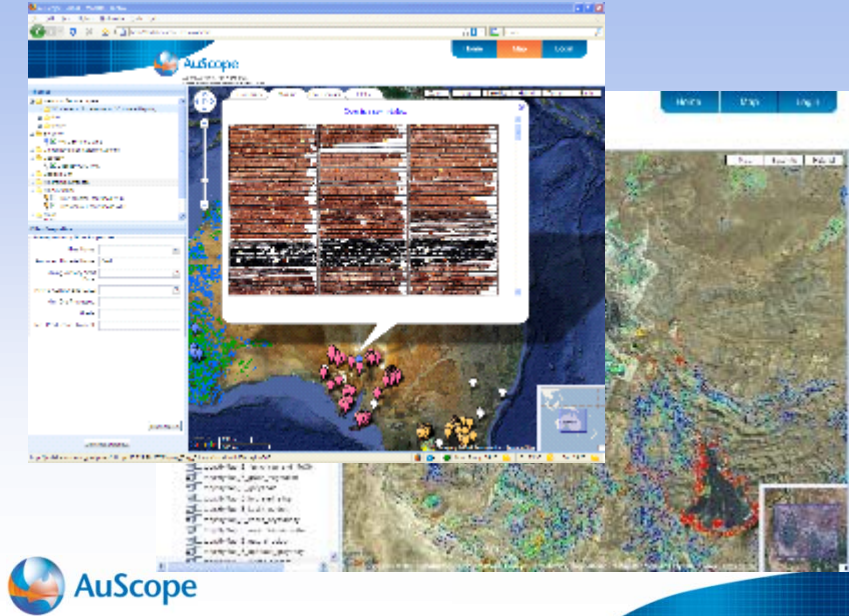

Geography Markup Language

25

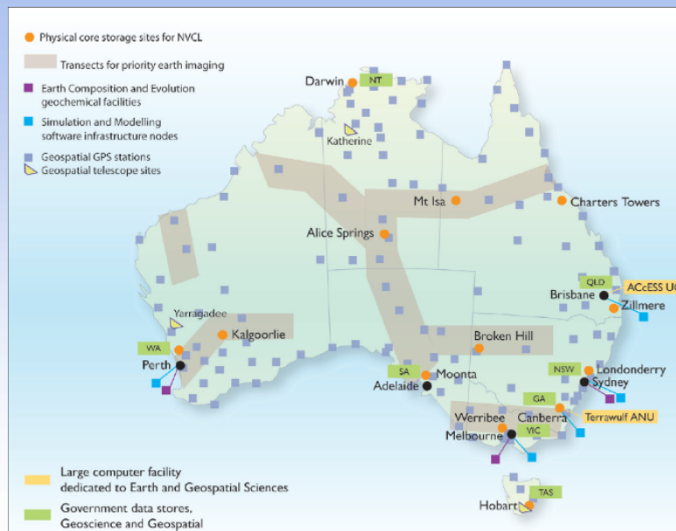

Discovery Portal - Surfing the Earth Model
