"Geospatial Information for a Smarter Life and Environmental Resilience"

What is the land use systems?

- Land use system (LUS) is a combination of a land use type with a separate land unit that forms two closely interrelated components. These interactions will determine the characteristics of the level and type of investment costs; land improvement; and productivity and yield of land use system (FAO, 1984; Driessen và Konijn (1992), Hermand Huizing (1995) và ITC (1998); Ministry of Agriculture and Rural Development, 2008).

FIG WORKING WEEK 2019

22-26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

Land Unit

Land use type

Land units are less changed due to human impact than land use types in a territory. Therefore, the diversity of LUS depends on the diversity of land use types.

The LUS group is closely related to natural conditions

LUS of agricultural production
LUS of rural settlements
LUS of urban settlements
LUS of agriculture

The LUS group relates to human settlement

- LUS of industrial zones and clusters
- LUS of exploits minerals
- LUS of builds materials and ceramics

The LUS group related to non-agricultural production

FIG WORKING WEEK 2019

22–26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

Firstly:
Demonstrates a compact combination of LU and LUT (Beek, 1981; FAO, 1984).

Secondly:
Provide an analytical framework to evaluate the effectiveness of variations in the system

Demonstrate the interrelationship between components in LUS at input and output

Evaluating ecological adaptability according to land use **system** approach will be more complete and allow for extrapolation in land evaluation.

22–26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

Study area

The total natural land area of the district is 15112.8 ha, of which agricultural land area is 9637.91 ha. Agriculture in the district aims to develop ecological villages and high-tech agriculture

"Geospatial Information for a Smarter Life and Environmental Resilience"

Agricultural land use system

- As a result, there are 46 agricultural land use systems based on a combination of 34 LU and 7 LUT
- LUS is showed by **n - X**, which X is the land use type, n is the land unit (for example: 5-LUC)

"Geospatial Information for a Smarter Life and Environmental Resilience"

CONCLUSION

- Evaluation of land use system is an important scientific basis for the sustainable agricultural land use planning.
- The agricultural land use system in Quoc Oai district is quite diverse with 46 LUS based on the analysis of 34 LU and 7 LUT.
- The percentage of Highly Suitable (S1) and Moderately Suitable (S2) is high, especially rice, fruit trees and vegetables. Quoc Oai district needs to focus on improving irrigation systems.
- In order to serve the spatial orientation of more objective and accurate land use planning, it is necessary to further evaluate the economic, social and environmental efficiency of agricultural land use systems.
